

Must-Have Skills –

- 1) LLMs (OpenAI, Azure OpenAI, Anthropic, Llama, etc.).
- 2) RAG, vector databases, embeddings, and model evaluation methods
- 3) Cloud-native architectures (Azure)
- 4) Excellent problem-solving, communication
- 5) Experience deploying GenAI solutions in production environments (MLOps – GENAI Ops)

Nice-to-have Skills—

- 1) BI/visualization tools (e.g., Power BI/Tableau)

Senior GenAI Engineer (LLMs, RAG)

We are looking for a senior-level GenAI engineer to lead the development of a large language model assistant for insurance sales advisors. You will design GenAI pipelines, oversee model evaluation and prompt engineering, and partner with engineering teams to bring solutions into production.

Day-to-Day Responsibilities

Architect LLM-based solutions (RAG pipelines, fine-tuning, embeddings, evaluation).

Build scalable GenAI microservices and integrate with internal systems.

Perform advanced prompt engineering, agent design, and safety guardrail development.

Evaluate models (open-source and commercial) for performance, risk, and cost.

Collaborate with data teams to prepare training data, knowledge bases, and analytics.

Ensure compliance with insurance regulations and enterprise security frameworks.

Mentor junior team members and establish best practices.

Partner with business stakeholders to define problem statements, data requirements, and delivery approaches; document data sources and maintain templates.

Oversee ongoing ingestion and refresh of knowledge bases and data pipelines supporting RAG; implement checks-and-balances and closed-loop measurement to improve solution quality over time.

Present model performance, insights, and business impact to senior stakeholders; develop business cases and incorporate change-management considerations for successful adoption.

Work with internal and external teams to productionize solutions and coach junior team members through delivery.

(People Leader role: No—individual contributor with mentorship responsibilities.)

Qualifications

6+ years in machine learning, NLP, or AI engineering; 2+ years in GenAI/LLM work.

Hands-on experience with LLMs (OpenAI, Azure OpenAI, Anthropic, Llama, etc.).

Strong expertise in RAG, vector databases, embeddings, and model evaluation methods.

Proficiency in Python, data pipelines, and cloud-native architectures (Azure preferred).

Experience deploying GenAI solutions in production environments.

Understanding of insurance sales, underwriting, or financial services is an asset.

Excellent problem-solving, communication, and cross-functional leadership skills.

Bachelor's degree in Computer Science, Math, Engineering, or equivalent practical experience.

Strong SQL and data modeling skills; familiarity with relational and NoSQL stores (e.g., Hadoop/NoSQL) and BI/visualization tools (e.g., Power BI/Tableau) is an asset. Working knowledge of classical ML and statistical methods (e.g., regression, tree-based models, clustering) and of applying systematic, structured processes to operationalize analytics/LLM insights. Demonstrated ability to translate technical results into business language, manage stakeholder expectations, and support change management for solution rollout

Story Behind the Need – Business Group & Key Projects:

Can you please provide an overview of what a typical day in this role would look like, inclusive of any team members they'd be working with, structure, size, and day-to-day duties

Typical Day

- Participate in the daily project update with the core team.
- Communicate with business & technical partners to confirm requirements and clarify timeline constraints.
- Propose and implement technical solutions based on business needs and project deadlines.
- Hands-on work with solution and architecture development tasks, validating the proposed results in POC format, but structuring.
- Sketch or draft Lucid Chart diagrams outlining proposed solutions to share with technical team.
- Log all tasks accurately and consistently in Jira.
- Collaborate closely with a project team of 2–3 members, plus the Data Infrastructure team, Web Backend and Web Front End Team.
- Mentor junior team members and establish best practices
- Report directly to the Project Team Lead.
